NFS-RPS was founded in Groton, Connecticut in 1978 as a department in General Dynamics Electric Boat. The company's first commercial contract was to work on mitigation of the effects of the Three Mile Island accident. With its core group of highly specialized engineers and technicians, NFS-RPS has maintained its technical capability to support its client base.

NFS-RPS' niche capability is the design of engineering-controls products and systems used to provide enhanced personnel protection by confining, controlling, and capturing radioactive and toxic contaminants. Custom designed shielding by NFS-RPS also minimizes the hazardous effects of ionizing radiation exposure. NFS-RPS' primary markets are the Department of Energy Weapons Complex Cleanup, Department of Defense Cleanup, control of high potency compounds for pharmaceutical R&D and manufacturing, and outage support for commercial nuclear power generators. The newly classified NFS-RPS will focus on improving its commercial and government customers' access to the same high quality systems, products, and services with new opportunities our small business registration will provide.
